FALQBIT

WHITEPAPER · VERSION 1.0

The token only quantum-safe accounts can hold.

FALQBIT is an Algorand Standard Asset that can only be held by accounts secured with Falcon-1024, a post-quantum signature scheme. The rule is enforced on-chain by an immutable contract.

2 November 2026 · falqbit.com · ASA ID 3760920399

01 The problem

Almost every crypto wallet today is protected by elliptic-curve signatures such as Ed25519 or ECDSA. They are secure against today's computers. A large enough quantum computer running Shor's algorithm could derive a private key from a public key, and then sign transactions as the owner.

Nobody knows when such a machine will exist. But public keys stay on-chain forever, and standards bodies are already moving: NIST selected Falcon as a post-quantum signature standard, and governments have set migration deadlines for critical systems around 2030. Assets that cannot move to post-quantum keys will be the easiest to attack.

Algorand added Falcon-1024 accounts to its MainNet, and wallets such as Pera now let anyone create a **Quantum Account**. What was missing was a reason to use one.

02 The solution

FALQBIT is the first token that **only post-quantum accounts can hold**. A classic account cannot receive it, hold it or trade it: the network itself refuses the transfer.

- **For users**, it is a simple, practical reason to move to a Quantum Account, with rewards for doing it.
- **For Algorand**, it is a live, public showcase of post-quantum accounts being used every day.
- **For everyone**, the rules are code: no admin, no clawback, no way to change them later.

03 How it works

Frozen by default

FALQBIT was created with *default frozen* set. Every account that adds the token starts locked. The freeze role does not belong to a person: it belongs to the **gate contract** (application 3760919863). The token has no manager and no clawback, so these settings can never change.

Proving a Falcon key

An account is unlocked only if it proves that a Falcon-1024 key signs for it. Algorand derives a Quantum Account's address from its Falcon public key:

```
address = SHA512-256("PQA" || "f1" || salt || public_key)
```

The user sends the public key and salt to the gate. The contract recomputes the address, checks that it matches the account (or the account's current signer, if it was rekeyed), and then unfreezes the holding. The unlock page at falqbit.com/unlock does all of this in one approval in Pera Wallet. A small deposit (about 0.03 ALGO) pays for the record the contract keeps.

Going back to classic gets you locked again

If an unlocked account later rekeys to a classic key, **anyone** can call the contract's relock method. The holding is frozen again and the caller receives the account's deposit as a reward. The tokens stay with their owner and unlock again once the account returns to a Falcon key.

Pools and contracts

Pools and other smart contracts have no signing key. They can hold FALQBIT only if the program that controls them is on the gate's approved list. **Tinyman v2** is the only approved program, so any Tinyman v2 pool can hold FALQBIT. The approver role has been **renounced**: the list can never grow or shrink.

04 Token facts

ITEM	VALUE
Name / unit	FALQBIT / FALQBIT
Network	Algorand MainNet
Asset ID	3760920399
Total supply	10,000,000,000 (fixed, no minting)
Decimals	6
Manager / clawback	None / None
Freeze role	Gate contract, application 3760919863 (immutable)
Main pool	Tinyman v2 FALQBIT/ALGO, pool token 3760920578
Launch	2 November 2026
Compiled gate (SHA-256)	f14801163a468bc7e990531cd866dd21fe69a6f5d0b7bf0bd71cd8109e4f95a9

05 Supply and allocation

The whole supply was minted once, at launch. Every allocation sits in a public account, so anyone can check the balances live on the supply section of the site or on any Algorand explorer.

ALLOCATION	SHARE	AMOUNT	PURPOSE
Liquidity pool	63%	6.3B	5.5B at launch with 500 ALGO, plus 800M with 186.37 ALGO added on 2 November 2026. Tokens bought by users leave the pool.
Hold-to-earn	25%	2.5B	Monthly rewards for holders
Welcome drop	2%	200M	1M for each of the first 200 accounts
Project reserve	5%	500M	Liquidity, contests and partners
Team	5%	500M	Held in a quantum account

Public accounts

ACCOUNT	ADDRESS
Project (creator, reserve, liquidity)	`OCAF6EHCGLZ3SJDE54SL2TBKNDLIQAUQDM6CAFQAFZ7LNLERA4SBY73YIU`
Rewards (hold-to-earn + welcome)	`V4J46SMHHEJHXRKXHA6MJKWFJMZIXQSMBPU5UC7W6BRUEYYB3SF7CPTC2Q`
Team	`XMKDQFY55TLREPRIUG3WLWPUPKFW33WPV7GZF6U22EWOXYWHLKTPGBDT7Q`
Tinyman v2 pool	`CEQH5WNK3VFUVGZ6WET7GO2JLZVYY7BDPCN74LGWEUWC5WCMPYU7M7VCIA`

All project accounts are Falcon-1024 Quantum Accounts. There was no presale, no private sale and no token sale other than the public Tinyman pool.

06 Rewards

Welcome drop

- **1,000,000 FALQBIT** for each of the first **200** quantum accounts that unlock. No purchase needed.

- One per person. The account must hold at least **2 ALGO** on payout day; accounts below that are skipped and can receive it in a later round.
- Paid in rounds from the Rewards account, with the note `FALQBIT welcome`. Accounts that look like duplicates of the same person may be excluded.

Hold-to-earn

- **0.5% a month** of each wallet's **lowest balance since the 1st** of the month, for wallets holding at least 1,000,000 FALQBIT.
- Paid on the **25th** of every month, with the note `FALQBIT hold YYYY-MM`.
- Maximum **500,000 FALQBIT** per wallet per month.
- The monthly pool is **15,000,000 FALQBIT**, shared by all holders. If everyone's 0.5% adds up to more, every payout shrinks in the same proportion.
- Launch month (November 2026): **1%** of the balance on the 25th, with the same cap and pool.
- No staking and nothing to claim. Tokens never leave the holder's wallet. Project accounts and pools are excluded.

YOU HOLD	YOU GET PER MONTH
1,000,000	5,000
10,000,000	50,000
100,000,000 or more	500,000 (max)

How long it lasts. The Hold-to-earn allocation is 2.5B FALQBIT. Even if the full 15M pool is paid every month, it lasts 166 months, nearly 14 years. Months that pay less make it last longer.

> **Important:** rewards are sent by the project from the public Rewards account. They are not enforced by a smart contract. Every payment is visible on-chain with its note, so anyone can check that the rules above were followed.

07 Joining and trading

1. **Create a Quantum Account** in Pera Wallet (Add account → Add Quantum Account), or rekey an existing account to a Falcon-1024 key.
2. **Unlock** it at falqbit.com/unlock. Adding the token and unlocking happen in one step.
3. **Buy, sell or hold** on Tinyman. Price and charts are on Vestige.

Fees. A Falcon-1024 signature is larger than a classic one, so each transaction costs about three minimum fees, around 0.003 ALGO. Tinyman charges its usual 0.3% swap fee, which goes to liquidity providers.

From FALQBIT to euros. Today: swap FALQBIT to ALGO on Tinyman, then ALGO to USDC. Soon this takes one approval on falqbit.com. Then send the USDC (or ALGO) to a regulated exchange that supports Algorand, sell it for euros and withdraw to your bank by SEPA. The project itself never converts FALQBIT to euros.

Exchanges. Pools on DEXs other than Tinyman v2 cannot hold FALQBIT. Centralized exchanges can list it by holding it in quantum accounts and unlocking them like any user.

08 Security and limits

What the code guarantees

- **No clawback.** Nobody can take tokens out of an account, not even the creator.
- **No admin key.** The freeze role is a public contract.
- **Immutable.** The gate cannot be updated or deleted, the token has no manager, and the approver role is renounced.
- **Open source.** The gate is under 200 lines of Algorand Python, published with its compiled program and ABI. An independent automated review found no way for a classic account to unlock. There has been **no professional audit** yet.

What FALQBIT does not solve

- **Consensus.** Algorand's accounts can be post-quantum, but block voting still uses classical keys. Post-quantum consensus is on Algorand's own roadmap.
- **Relocking is after the fact.** An account that rekeys back to classic stays unlocked until someone calls relock.
- **Code-controlled addresses.** Pool and application addresses are hashes, not keys. Their long-term quantum safety depends on Algorand's protocol, not on this contract.
- **One DEX family.** The approved list is final: only Tinyman v2 pools can hold FALQBIT.

09 Roadmap and vision

FALQBIT starts as a token. The goal is to become a simple way to **use** post-quantum money every day. The phases below are plans, not promises, and have no fixed dates.

PHASE	GOAL
Done	TestNet rehearsal, MainNet launch, gate contract, Tinyman pool, unlock page, rewards live, deeper liquidity, this whitepaper.
Now	Verification on Pera (all checks passed, in review), logo on Tinyman and Vestige, listing in Algorand project directories.
Next	**Trade on falqbit.com**: swap ALGO ⇄ FALQBIT and **USDC ⇄ FALQBIT** in one approval, with the right fees for quantum accounts. USDC is the bridge to euros: it can be sold at any regulated exchange.
Then	**FALQBIT mobile app**: wallet, swaps, and QR payments between people and shops, with a shop mode that shows prices in euros and lets shops receive USDC.
Later	First shops and services accepting FALQBIT. Listings on trackers such as CoinGecko, and more wallets and explorers.
Future	Partnerships with **licensed** payment companies, so holders can spend USDC anywhere cards are accepted. FALQBIT will not act as a payment institution itself.

10 Risks and legal notice

FALQBIT is not an investment product. It gives no right to profits, dividends, interest, governance or redemption, and nothing in this document is financial advice or a promise of returns.

- **Price risk.** The price is set only by the market and can fall to zero. Liquidity is small and prices can move sharply.
- **Smart contract risk.** The gate is immutable and has not been professionally audited. A bug could not be fixed.
- **Reward risk.** Rewards depend on the project continuing to send them. They can shrink when many people hold.
- **Key risk.** Losing a recovery phrase means losing the tokens. Nobody can recover them.
- **Technology risk.** Post-quantum cryptography and Algorand's Falcon accounts are new. Wallet or protocol changes could affect how FALQBIT works.
- **Regulatory risk.** Crypto-asset rules, including the EU's MiCA regulation, keep changing and could affect how FALQBIT can be offered, listed or used in some countries.

Only acquire FALQBIT with money you can afford to lose. Always check the official asset ID **3760920399**: anyone can create a token with the same name.
